

Universal Display - Software Release Version 2.1.8

The NetThings Universal Display can be updated to take advantage of new features and improvements.

Details of software releases and the update process can be found at www.netthings.co.uk/softwareupdates

Displays can only be updated if version 2.1.6 (or later) is present. Earlier versions (2.1.2 to 2.1.5) cannot be updated via the supplied update package method.

Details

Date of Release	30th August 2018
Exact Version	2.1.8+rev.b833b38

New in this release

NAA-352	The default kiosk browser can now provide a single pop-up window to open. This will open over the parent page and can be closed at any time to return.
NAA-307	It is now possible to access external network resources or content, via a controlled list. Please contact NetThings for further information enabling this feature.
NAA-355	The default kiosk browser now detects navigation dead ends caused by HTTP errors. The display will now briefly show an error message and then navigate back to main page of the content source. Previous resolution would have required a restart of the display.
NAA-346	Following a reboot of the display, and when multiple content sources are configured, the content source that was last viewed on the display will be retained. Previously after a reboot the 1 st content source in the list would be shown by default.

Defects Fixed

NAA-354	It is now easier to enter text into input fields in the default kiosk browser. Previously it was possible that the keyboard would hide the input field box with no way to scroll the field into view. Now the field should always be visible as the page can be scrolled when the keyboard is present.
NAA-327	When switching between WIFI and Ethernet connectivity options after content sources have been setup, users are now prompted to restart the display.
NAA-333	Global IPv6 addresses are now included as part of the integrated firewall. Previously they were accessible, therefore websites and network resources with an IPv6 address could be reached. From this release, only local IPv6 addresses are allowed.
NAA-351	Upon RESET, WIFI network and preferences are now correctly cleared in all circumstances
NAA-357	Android settings menu is no longer shown on swipe down from the top of page, when in browser mode.

Known Issues

NAA-353	<p>When displaying a Niagara 4.2 station, context menus are not available. A long press on the screen would normally show a context menu if a page has registered a context menu on some elements. This is equivalent to a right click on a PC/ laptop.</p> <p>Niagara 4.2 software prevents the context menus from showing on the display.</p> <p>Tridium has confirmed that this issue has been fixed in Niagara 4.4, so display customers are invited to upgrade their Niagara software if they rely on context menus.</p>
